Index	39

Generate Hierarchical Triangular Mesh (HTM) IDs, crossmatch sets of sky-coordinates and more.

Documentation for HMpTy is hosted by [Read the Docs](#) ([development version](#) and [master version](#)). The code lives on [github](#). Please report any issues you find [here](#).

**CHAPTER
ONE**

FEATURES

.

1.1 Installation

The easiest way to install HMpTy is to use pip (here we show the install inside of a conda environment):

```
conda create -n HMpTy python=3.7 pip
conda activate HMpTy
pip install HMpTy
```

Or you can clone the [github repo](#) and install from a local version of the code:

```
git clone git@github.com:thespacedoctor/HMpTy.git
cd HMpTy
python setup.py install
```

To upgrade to the latest version of HMpTy use the command:

```
pip install HMpTy --upgrade
```

To check installation was successful run HMpTy -v. This should return the version number of the install.

1.1.1 Development

If you want to tinker with the code, then install in development mode. This means you can modify the code from your cloned repo:

```
git clone git@github.com:thespacedoctor/HMpTy.git
cd HMpTy
python setup.py develop
```

Pull requests are welcomed!

1.2 Initialisation

Before using HMpTy you need to use the `init` command to generate a user settings file. Running the following creates a `yaml` settings file in your home folder under `~/.config/HMpTy/HMpTy.yaml`:

```
HMpTy init
```

The file is initially populated with HMpTy's default settings which can be adjusted to your preference.

If at any point the user settings file becomes corrupted or you just want to start afresh, simply trash the `HMpTy.yaml` file and rerun `HMpTy init`.

1.2.1 Modifying the Settings

Once created, open the settings file in any text editor and make any modifications needed.

1.2.2 Basic Python Setup

If you plan to use `hmpty` in your own scripts you will first need to parse your settings file and set up logging etc. One quick way to do this is to use the `fundamentals` package to give you a logger, a settings dictionary and a database connection (if connection details given in settings file):

```
## SOME BASIC SETUP FOR LOGGING, SETTINGS ETC
from fundamentals import tools
from os.path import expanduser
home = expanduser("~")
settingsFile = home + "/.config/hmpty/hmpty.yaml"
su = tools(
    arguments={"settingsFile": settingsFile},
    docString=__doc__,
)
arguments, settings, log, dbConn = su.setup()
```

1.3 Command-Line Tutorial

1.3.1 Indexing Database Tables with HTMids

HMpTy can be used from the command-line to add Hierarchical Triangular Mesh (HTM) IDs to any database table that has populated equatorial coordinate columns.

To generate and populate the `htm10ID`, `htm13ID` and `htm16ID` columns on a table run either:

```
hmpty index transientBucket primaryKeyId raDeg decDeg -s /path/to/my-settings.yaml
```

where the settings file contains the database credentials:

database settings:

```
db: mydatabase
host: localhost
user: myusername
password: mypass
```

Or alternatively you can pass the credentials in directory via the command-line (less secure obviously):

```
hmpty index transientBucket primaryKeyId raDeg decDeg --host localhost --user
↪myusername --passwd mypass --dbName mydatabase
```

1.3.2 Conesearching Database Tables

It's possible to perform a conesearch on a database table (with existing HTMId columns pre-populated) from the command-line.

The syntax for the cl-conesearch is:

```
hmpty search <tableName> <raCol> <decCol> <ra> <dec> <radius> (-s <pathToSettingsFile>
↪| --host <host> --user <user> --passwd <passwd> --dbName <dbName>)
```

So to perform a 10 arcsec conesearch on a *transientBucket* table with ra and dec columns named *raDeg* and *decDeg* respectively around the coordinates “21:19:41.31”, “+21:57:56.3”:

```
hmpty search transientBucket raDeg decDeg 21:19:41.31 +21:57:56.3 10. -s /path/to/my-
↪settings.yaml
```

Column	Type	Description
primaryKeyId	String	Unique identifier for each transient entry
raDeg	Double	Right Ascension in degrees
decDeg	Double	Declination in degrees
instrument	String	Name of the instrument used for detection
hostRedshift	Double	Redshift of the host galaxy
filter	String	Filter used for imaging
finderImageURL	String	URL of the finder image
htm13ID	String	HTM13 ID
htm16ID	String	HTM16 ID
htm20ID	String	HTM20 ID
lastNonDetectionDate	Timestamp	Date of the last non-detection
lastNonDetectionMJD	Double	Middle Julian Date of the last non-detection
magnitude	Double	Apparent magnitude
magnitudeError	Double	Magnitude error
maglimit	Double	Limiting magnitude
reduced	Boolean	Reduced flag
replacedByRowId	String	Row ID of the replaced row
transientBucketId	String	Transient Bucket ID
transientRedshiftNotes	String	Notes about the transient redshift
transientTypePrediction	String	Prediction of the transient type
transientTypePredicationSource	String	Source of the transient type prediction
tripletImageURL	String	URL of the triplet image
surveyObjectURL	String	Survey object URL
targetImageURL	String	Target image URL
dateCreated	Timestamp	Date of creation
dateDeleted	Timestamp	Date of deletion
dateLastModified	Timestamp	Date of last modification
dateLastRead	Timestamp	Date of last read
cmSepArcsec	Double	Angular separation in arcseconds
classificationPhase	String	Classification phase
classificationWRTMax	String	Classification wrt max
observationDate	Timestamp	Observation date
observationMJD	Double	Middle Julian Date of observation
name	String	Transient name
raDegErr	Double	Error in Right Ascension
raErr	Double	Error in Right Ascension
recalibrated	Boolean	Recalibrated flag
redshift	Double	Redshift
subtractedImageURL	String	Subtracted image URL
transientRedshift	Double	Transient redshift
z	Double	Z value

Note RA and DEC can be in either sexagesimal or decimal degree formats.

Again, you can instead pass in the database credentials via the

command-line instead of a settings file:

```
hmpty search transientBucket raDeg decDeg 319.92212 21.96564 10. --host localhost --
→ user myusername --passwd mypass --dbName mydatabase
```

1.4 Renders

To render the results of the conesearch as json, csv, yaml or markdown

use the `-r <format>` flag. For example:

```
hmpty search transientBucket raDeg decDeg 21:19:41.31 +21:57:56.3 10. -s /path/to/my-
→ settings.yaml -r json
```

```
[  
{  
  "classificationPhase": null,  
  "classificationWRTMax": null,  
  "cmSepArcsec": 0.0043467057710126393,  
  "cx": 0.709625112642,
```

(continues on next page)

(continued from previous page)

```

"cy": -0.597091649225,
"cz": 0.374050480461,
"dateCreated": "20160930t192332",
"dateDeleted": null,
"dateLastModified": "20160930t192332",

"decDegErr": null,
"discoveryPhase": null,
"filter": "Clear-",
"finderImageUrl": null,
"hostRedshift": null,
....
```

It's possible to also render the results as MySQL insert statements, but

the name of the table to insert the result into is also needed.

```
hmpty search transientBucket raDeg decDeg 21:19:41.31 +21:57:56.3 10. -s /path/to/my-
˓→settings.yaml -r mysql my_results
```

1.5 Todo List

Todo:

- nice!
-

(The *original entry* is located in /home/docs/checkouts/readthedocs.org/user_builds/hmpty/checkouts/develop/docs/source/_template_.md line 1.)

1.6 Release Notes

v1.5.5 - December 8, 2021

- **FIXED** Install on macOS monterey

v1.5.4 - August 16, 2021

- **FIXED** Command-line tools

v1.5.3 - June 23, 2020

- **FIXED** When matching 2 lists of coordinates, if a list location was matched against more than one item in the second match list the angular separation of the first match got over-written by the second match.

v1.5.1 - May 19, 2020

- **FIXED** MacOS install was needlessly involved.

v1.5.0 - May 8, 2020

- Now compatible with python 3.*

CHAPTER
TWO

API REFERENCE

2.1 Modules

<code>HMpTy.commonutils</code>	<i>common tools used throughout package</i>
<code>HMpTy.htm</code>	<i>The HTM and Matcher Objects</i>
<code>HMpTy.mysql</code>	<i>MySQL tools involving HTMs</i>
<code>HMpTy.htm.htm</code>	<i>Tools for working with Hierarchical Triangular Meshes, including coordinate crossmatching</i>
<code>HMpTy.utKit</code>	<i>Unit testing tools</i>

2.1.1 commonutils (*module*)

common tools used throughout package

2.1.2 htm (*module*)

The HTM and Matcher Objects

Classes

<code>HTM([depth, log])</code>	<i>A Hierarchical Triangular Mesh object</i>
<code>Matcher(ra, dec[, depth, log, convertToArray])</code>	<i>A matcher-array object to match other arrays of ra,dec against</i>
<code>sets(log, ra, dec, radius, sourceList[, ...])</code>	<i>Given a list of coordinates and a crossmatch radius, split the list up into sets of associated locations</i>

2.1.3 mysql (*module*)

MySQL tools involving HTMs

Classes

<code>conesearch(log, dbConn, tableName, columns, ...)</code>	<i>The worker class for the conesearch module</i>
---	---

Functions

<code>add_htm_ids_to_mysql_database_table(...[, Given a database connection, a name of a table and the ...])</code>	<i>Given a database connection, a name of a table and the column names for RA and DEC, generates ID for one or more HTM level in the table</i>
---	--

2.1.4 htm (*module*)

Tools for working with Hierarchical Triangular Meshes, including coordinate crossmatching

Author David Young (originally forked from Erin Sheldon's esutil - esheldon)

Classes

<code>HTM([depth, log])</code>	<i>A Hierarchical Triangular Mesh object</i>
<code>Matcher(ra, dec[, depth, log, convertToArray])</code>	<i>A matcher-array object to match other arrays of ra,dec against</i>
<code>tools(arguments, docString[, logLevel, ...])</code>	<i>common setup methods & attributes of the main function in cl-util</i>
<code>unit_conversion(log[, settings])</code>	<i>The worker class for the unit_conversion module</i>

Functions

<code>old_div(a, b)</code>	<i>Equivalent to a / b on Python 2 without from __future__ import division.</i>
----------------------------	---

2.1.5 utKit (*module*)

Unit testing tools

Classes

<code>utKit(moduleDirectory[, dbConn])</code>	<i>Override dryx utKit</i>
---	----------------------------

2.2 Classes

<code>HMpTy.htm.htm.HTM</code>	<i>A Hierarchical Triangular Mesh object</i>
<code>HMpTy.htm.htm.Matcher</code>	<i>A matcher-array object to match other arrays of ra,dec against</i>
<code>HMpTy.htm.sets</code>	<i>Given a list of coordinates and a crossmatch radius, split the list up into sets of associated locations</i>
<code>HMpTy.mysql.conesearch</code>	<i>The worker class for the conesearch module</i>

2.2.1 HTM (*class*)

class `HTM(depth=16, log=False)`
Bases: `HMpTy.htm._htmcCode.HTMC`

A Hierarchical Triangular Mesh object

Key Arguments

- `depth` – the depth of the mesh you wish to create. Default `16`

Usage

To generate a mesh object:

```
from HMpTy import HTM
mesh16 = HTM(
    depth=16
)
```

Methods

`cbincount(*args)`

`cmatch(*args)`

`init([depth])`

<code>intersect(ra, dec, radius[, inclusive, ...])</code>	<i>return IDs of all triangles contained within and/or intersecting a circle centered on a given ra and dec</i>
---	---

<code>lookup_id(ra, dec)</code>	<i>Lookup the ID of HTM trixel that a coordinate or lists of coordinates lie on</i>
---------------------------------	---

<code>match(ra1, dec1, ra2, dec2, radius[, ...])</code>	<i>Crossmatch two lists of ra/dec points</i>
---	--

Properties

<code>area</code>	<i>The mean area of triangles in this mesh in units of square degrees.</i>
<code>depth</code>	<i>the depth of the HTM tree</i>

intersect (*ra, dec, radius, inclusive=True, convertCoordinates=True*)
return IDs of all triangles contained within and/or intersecting a circle centered on a given ra and dec

Key Arguments

- `ra` – RA of central point in decimal degrees or sexagesimal
- `dec` – DEC of central point in decimal degrees or sexagesimal
- `radius` – radius of circle in degrees
- `inclusive` – include IDs of triangles that intersect the circle as well as those completely inclosed by the circle. Default `True`
-

Return

- `trixelArray` – a numpy array of the match trixel IDs

Usage

To return the trixels overlapping a circle with a 10 arcsec radius centred at 23:25:53.56, +26:54:23.9

```
overlappingTrixels = mesh16.intersect(  
    ra="23:25:53.56",  
    dec="+26:54:23.9",  
    radius=10 / (60 * 60),  
    inclusive=True  
)
```

Or to return the trixels completely enclosed by a circle with a 1 degree radius centred at 23:25:53.56, +26:54:23.9

```
overlappingTrixels = mesh16.intersect(  
    ra="23:25:53.56",  
    dec="+26:54:23.9",  
    radius=1,  
    inclusive=False  
)
```

lookup_id(*ra, dec*)

Lookup the ID of HTM trixel that a coordinate or lists of coordinates lie on

Key Arguments

- `ra` – list, numpy array or single ra value (first coordinate set)
- `dec` – list, numpy array or single dec value (first coordinate set - must match `ra` array length)

Return

- `htmIds` – a list of HTM trixel ids the coordinates lie on

Usage

To find the trixel IDs that a set of coordinates lie on:

```

raList1 = ["13:20:00.00", 200.0, "13:20:00.00", 175.23, 21.36]
decList1 = ["+24:18:00.00", 24.3, "+24:18:00.00", -28.25, -15.32]

htmids = mesh.lookup_id(raList1, decList1)
for h, r, d in zip(htmids, raList1, decList1):
    print(r, d, " --> ", h)

```

match(*ra1, dec1, ra2, dec2, radius, maxmatch=1, convertToArray=True*)

Crossmatch two lists of ra/dec points

This is very efficient for large search angles and large lists. Note, if you need to match against the same points many times, you should use a `Matcher` object

Key Arguments

- `ra1` – list, numpy array or single ra value (first coordinate set)
- `dec1` – list, numpy array or single dec value (first coordinate set - must match `ra1` array length)
- `ra2` – list, numpy array or single ra value (second coordinate set)
- `dec2` – list, numpy array or single dec value (second coordinate set - must match `ra2` array length)
- `radius` – search radius in degrees. Can be list, numpy array or single value. If list or numpy array must be same length as `ra1` array length)
- `maxmatch` – maximum number of matches to return. Set to 0 to match all points. Default 1 (i.e. closest match)
- `convertToArray` – convert the coordinates into an array. Default *True*. Can bypass the conversion check if you are sure coordinates in numpy array

Return

- `matchIndices1` – match indices for list1 (`ra1, dec1`)
- `matchIndices2` – match indices for list2 (`ra2, dec2`)
- `sepDeg` – separations between matched coordinates in degrees. All returned arrays are the same size

Usage

To match 2 lists of coordinates try something like this:

```

twoArcsec = 2.0 / 3600.
raList1 = [200.0, 200.0, 200.0, 175.23, 21.36]
decList1 = [24.3, 24.3, 24.3, -28.25, -15.32]
raList2 = [200.0, 200.0, 200.0, 175.23, 55.25]
decList2 = [24.3 + 0.75 * twoArcsec, 24.3 + 0.25 * twoArcsec,
            24.3 - 0.33 * twoArcsec, -28.25 + 0.58 * twoArcsec, 75.22]
matchIndices1, matchIndices2, seps = mesh.match(
    ra1=raList1,
    dec1=decList1,
    ra2=raList2,
    dec2=decList2,
    radius=twoArcsec,
    maxmatch=0
)

for m1, m2, s in zip(matchIndices1, matchIndices2, seps):
    print(raList1[m1], decList1[m1], " -> ", s * 3600., " arcsec -> ", ↴
          raList2[m2], decList2[m2])

```

Note from the print statement, you can index the arrays `raList1`, `decList1` with the `matchIndices1` array values and `raList2`, `decList2` with the `matchIndices2` values.

property area

The mean area of triangles in this mesh in units of square degrees.

Usage

```
mesh.area
```

property depth

the depth of the HTM tree

Usage

```
mesh.depth
```

2.2.2 Matcher (class)

class **Matcher** (*ra, dec, depth=16, log=False, convertToArray=True*)

Bases: HMpTy . htm._htmcCode.Matcher

A matcher-array object to match other arrays of ra,dec against

The Matcher object is initialized with a set of ra,dec coordinates and can then be used and reused to match against other sets of coordinates

Key Arguments

- `log` – logger
- `depth` – the depth of the mesh generate the Matcher object at. Default *16*
- `ra` – list, numpy array or single ra value
- `dec` – list, numpy array or single dec value (must match ra array length)
- `convertToArray` – convert the coordinates into an array. Default *True*. Can bypass the conversion check if you are sure coordinates in numpy array

Return

- None

Usage

If we have a set of coordinates such that:

```
raList1 = [200.0, 200.0, 200.0, 175.23, 21.36]
decList1 = [24.3, 24.3, 24.3, -28.25, -15.32]
```

We can initialise a matcher object like so:

```
from HMpTy import Matcher
coordinateSet = Matcher(
    log=log,
    ra=raList1,
    dec=decList1,
    depth=16
)
```

Methods

<code>get_depth()</code>	
<code>match(ra, dec, radius[, maxmatch])</code>	<i>match a coordinate set against this Matcher object's coordinate set</i>

Properties

<code>depth</code>	<i>the depth of the Matcher object</i>
--------------------	--

`match(ra, dec, radius, maxmatch=1)`
match a coordinate set against this Matcher object's coordinate set

Key Arguments

- `ra` – list, numpy array or single ra value
- `dec` – list, numpy array or single dec value (must match ra array length)
- `radius` – radius of circle in degrees
- `maxmatch` – maximum number of matches to return. Set to 0 to match all points. Default 1 (i.e. closest match)

Return

- None

Usage

Once we have initialised a Matcher coordinateSet object we can match other coordinate sets against it:

```
twoArcsec = 2.0 / 3600.
raList2 = [200.0, 200.0, 200.0, 175.23, 55.25]
decList2 = [24.3 + 0.75 * twoArcsec, 24.3 + 0.25 * twoArcsec,
            24.3 - 0.33 * twoArcsec, -28.25 + 0.58 * twoArcsec, 75.22]

matchIndices1, matchIndices2, seps = coordinateSet.match(
    ra=raList2,
    dec=decList2,
    radius=twoArcsec,
    maxmatch=0
)

for m1, m2, s in zip(matchIndices1, matchIndices2, seps):
    print(raList1[m1], decList1[m1], " -> ", s * 3600., " arcsec -> ", ↴
          raList2[m2], decList2[m2])
```

Or to return just the nearest matches:

```
matchIndices1, matchIndices2, seps = coordinateSet.match(
    ra=raList2,
    dec=decList2,
    radius=twoArcsec,
    maxmatch=1
)
```

Note from the print statement, you can index the arrays `raList1`, `decList1` with the `matchIndices1` array values and `raList2`, `decList2` with the `matchIndices2` values.

property depth

the depth of the Matcher object

Usage

```
coordinateSet.depth
```

2.2.3 sets (class)

class sets(*log, ra, dec, radius, sourceList, convertToArray=True*)

Bases: `object`

Given a list of coordinates and a crossmatch radius, split the list up into sets of associated locations

Key Arguments

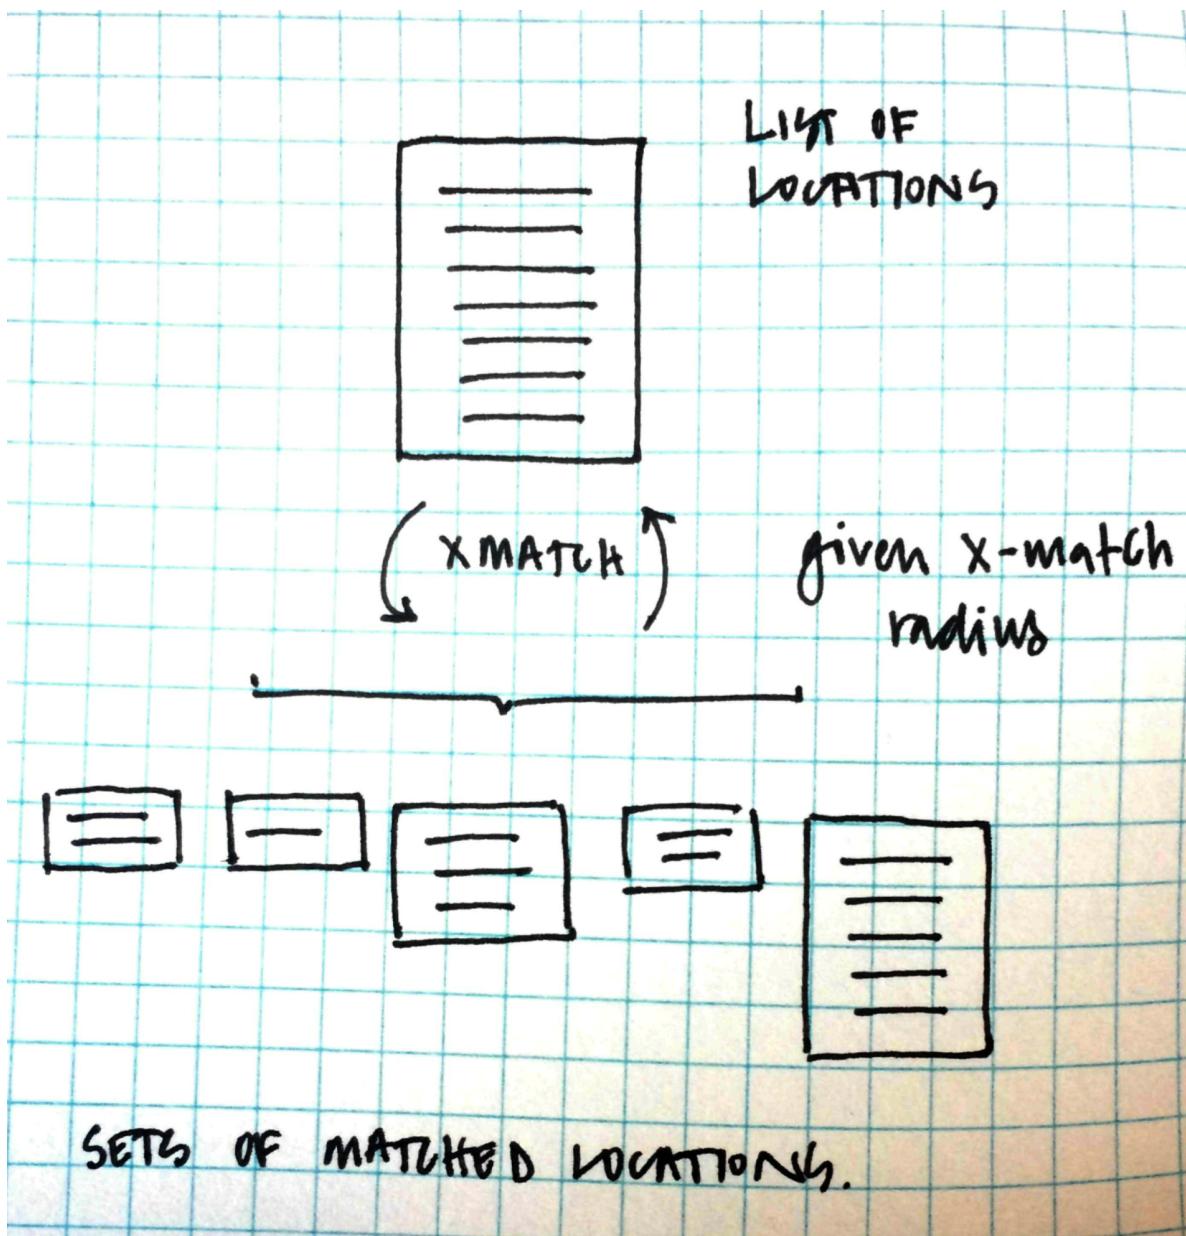

- `log` – logger
- `ra` – a list of the coordinate right ascensions
- `dec` – a list of the coordinate declinations (same length as `ra`)
- `radius` – the radius to crossmatch the list of coordinates against itself (degrees)
- `sourceList` – the list of source information to be divided into associated sets (same length as `ra` and `dec`)
- `convertToArray` – convert the coordinates into an array. Default `True`. Can bypass the conversion check if you are sure coordinates in numpy array

Usage

Given a list of transient metadata (any list, possibly a list of dictionaries) you can divide the list to associated sets of transients by running the following code:

```
from HMpTy.htm import sets
xmatcher = sets(
    log=log,
    ra=raList,
    dec=decList,
    radius=10 / (60. * 60.),
    sourceList=transientList
)
allMatches = xmatcher.match
```

`raList` and `decList` are the coordinates for the sources found in the `transientList` and are therefore the same length as the `transientList` (it's up to the user to create these lists). This code will group the sources into set of associated transients which are within a radius of 10 arcsecs from one-another. `allMatches` is a list of lists, each contained list being an associate group of sources.

```
:width: 800px  
:alt: divide a list of sources into associated sets
```

Methods

Properties

match	<i>all of the associated sets of sources</i>
-------	--

property **match**

all of the associated sets of sources

See the class for usage

2.2.4 conesearch (*class*)

```
class conesearch(log, dbConn, tableName, columns, ra, dec, radiusArcsec, sqlWhere=False,  
                 raCol='raDeg', decCol='decDeg', separations=False, distinct=False, closest=False)
```

Bases: object

The worker class for the conesearch module

Key Arguments

- log – logger
- dbConn – a database connection
- tableName – the name of the database table to perform the conesearch on.
- columns – the columns requested from the database table
- ra – the right ascension of the conesearch centre, can be single value or list of values
- dec – the declination of the conesearch centre, can be single value or list of values
- radiusArcsec – radius of the conesearch to be performed in arcsecs
- sqlWhere – clause to add after “where” in the initial sql query of the conesearch. Default *False*
- raCol – the database table ra column name. Default * *raDeg**
- decCol – the database table dec column name. Default *decDeg*
 - separations – include the separations in the final output. Default *False*
 - distinct – request distinct columns from the database table (i.e. *select DISTINCT ...*). Default *False*
 - closest – return the closest match only. Default *False*

Usage

Say we have 5 locations we wish to search a database table called *transientBucket* to see if it contains sources at those locations. Add the coordinates to those locations to RA and DEC lists like so:

```
raList = ["23:25:53.56", "02:10:08.16",  
          "13:20:00.00", 1.47329, 35.34279]  
decList = ["+26:54:23.9", "-48:38:24.3",  
           "+24:18:00.00", 8.43016, -42.34428]
```

Note coordinates can be in decimal degrees or sexagesimal format (or both).

To initialise a 10 arcsec conesearch to return the *transientBucketId* and *spectralType* values from any resulting match use the code:

```
from HMpTy.mysql import conesearch
cs = conesearch(
    log=log,
    dbConn=dbConn,
    tableName="transientBucket",
    columns="transientBucketId, spectralType",
    ra=raList,
    dec=decList,
    radiusArcsec=10,
    separations=False,
    distinct=False,
    sqlWhere=False
)
```

Using the query property of the conesearch object you can inspect the initial sql query to be run on the database:

```
print(cs.query)
```

```
select transientBucketId, spectralType, raDeg, decDeg from transientBucket where
↳ htm16ID in (51985593986, 51985593989, 51985593993, 51985593994, 51985593995,
↳ 51985593996, 51985593997, 51985593998, 51985593999, 51985594037, ..., 38488627914,
↳ 38488627916, 38488627918, 38488627919, 38488627956, 38488627957, 38488627959)
```

To execute the query and return the results:

```
matchIndies, matches = cs.search()
```

The matchIndies are the indices of the coordinate in the original raList and decList lists and the matches the matched rows from the database table.

To constrain your results a little more define the distinct and or sqlWhere attributes of the conesearch:

```
from HMpTy.mysql import conesearch
cs = conesearch(
    log=log,
    dbConn=dbConn,
    tableName="transientBucket",
    columns="transientBucketId, spectralType",
    ra=raList1,
    dec=decList1,
    radiusArcsec=10,
    separations=True,
    distinct=True,
    sqlWhere="spectralType is not null"
)

matchIndies, matches = cs.search()

for row in matches.list:
    print(row)
```

```
'''text
{'raDeg': 351.473208333, 'cmSepArcsec': 0.13379807128325164, 'decDeg': 26.
↳ 9066388889, 'spectralType': u'SN Ia', 'transientBucketId': 1375799L}
{'raDeg': 32.534, 'cmSepArcsec': 0.031941633602975743, 'decDeg': -48.6400888889,
↳ 'spectralType': u'II', 'transientBucketId': 1328883L}
```

(continues on next page)

(continued from previous page)

```
{
  'raDeg': 1.47329166667, 'cmSepArcsec': 0.0068727452774991196, 'decDeg': 8.
  ↵43016111111, 'spectralType': u'SN Ia', 'transientBucketId': 1321322L}
{
  'raDeg': 35.3427916667, 'cmSepArcsec': 0.0043467057710126393, 'decDeg': -42.
  ↵3442805556, 'spectralType': u'Ia', 'transientBucketId': 1307226L}
```

```

Note that by adding ``separations=True`` the matched source separations from the original coordinate lists have been injected into the results.

It is possible to render the results in csv, json, markdown, yaml or ascii table format. For example:

```
```python
print(matches.table())
```

```text
+-----+-----+-----+-----+
| raDeg | spectralType | decDeg | cmSepArcsec | transientBucketId |
+-----+-----+-----+-----+
| 351.4732 | SN Ia | 26.9066 | 0.1338 | 1375799 |
| 32.5340 | II | -48.6401 | 0.0319 | 1328883 |
| 1.4733 | SN Ia | 8.4302 | 0.0069 | 1321322 |
| 35.3428 | Ia | -42.3443 | 0.0043 | 1307226 |
+-----+-----+-----+-----+
```

```

To save the results to file:

```
```python
matches.table(filepath="/path/to/my/results.dat")
```

```

To instead render as csv, json, markdown or yaml use:

```
```python
matches.csv(filepath="/path/to/my/results.csv")
matches.json(filepath="/path/to/my/results.json")
matches.markdown(filepath="/path/to/my/results.md")
matches.markdown(filepath="/path/to/my/results.yaml")
```

```

Finally, to render the results as mysql inserts, use the following code:

```
```python
matches.mysql(tableName="mysql_table", filepath=None, createStatement=False)
```

```text
INSERT INTO `mysql_table` (cmSepArcsec, decDeg, raDeg, spectralType,
  ↵transientBucketId) VALUES ("0.133798071283", "26.9066388889", "351.473208333",
  ↵"SN Ia", "1375799") ON DUPLICATE KEY UPDATE cmSepArcsec="0.133798071283",

```

Methods

<code>search()</code>	<i>Return the results of the database conesearch</i>
-----------------------	--

Properties

<code>query</code>	<i>return the sql query for the HTM trixel search</i>
--------------------	---

search()
Return the results of the database conesearch

Return

- `conesearch`

Usage

See class usage.

property query
return the sql query for the HTM trixel search

Usage

cs.query

2.3 Functions

`HMpTy.mysql.add_htm_ids_to_mysql_database_table` Given a database connection, a name of a table and the column names for RA and DEC, generates ID for one or more HTM level in the table

2.3.1 add_htm_ids_to_mysql_database_table (*function*)

`add_htm_ids_to_mysql_database_table`(*raColName*, *declColName*, *tableName*, *dbConn*, *log*,
 primaryIdColumnName='primaryId', *cartesian=False*,
 batchSize=50000, *reindex=False*, *dbSettings=False*)

Given a database connection, a name of a table and the column names for RA and DEC, generates ID for one or more HTM level in the table

Key Arguments

- *raColName* – ra in sexagesimal
- *declColName* – dec in sexagesimal
- *tableName* – name of table to add htmid info to
- *dbConn* – database hosting the above table
- *log* – logger
- *primaryIdColumnName* – the primary id for the table
- *cartesian* – add cartesian columns. Default *False*
- *batchSize* – the size of the batches of rows to add HTMIDs to concurrently. Default *2500*
- *reindex* – reindex the entire table
- *dbSettings* – yaml settings for database

Return

- None

Usage

```
from HMpTy.mysql import add_htm_ids_to_mysql_database_table
add_htm_ids_to_mysql_database_table(
    raColName="raDeg",
    declColName="decDeg",
    tableName="my_big_star_table",
    dbConn=dbConn,
    log=log,
    primaryIdColumnName="primaryId",
    reindex=False
)
```

--	--

**CHAPTER
THREE**

RELEASE NOTES

v1.5.5 - December 8, 2021

- **FIXED** Install on macOS monterey

v1.5.4 - August 16, 2021

- **FIXED** Command-line tools

v1.5.3 - June 23, 2020

- **FIXED** When matching 2 lists of coordinates, if a list location was matched against more than one item in the second match list the angular separation of the first match got over-written by the second match.

v1.5.1 - May 19, 2020

- **FIXED** MacOS install was needlessly involved.

v1.5.0 - May 8, 2020

- Now compatible with python 3.*
